DAT305- Project Guidelines

The objective of group projects in this course is to solve problems by working with real-world datasets. The aim is to think like a data scientist and go through all the steps of a typical data science project.

During this project, the student will learn about designing a research plan, preprocessing data, preparing input for the model, selecting an algorithm and training the model, interpreting the results, and evaluating and reporting the outcomes scientifically.

General Rules:

- Every project has a distinct dataset, and you must perform the exploratory analysis necessary for the final task.
- Each group may consist of **2–5 students** (i.e., two, three, four, or five students). In exceptional cases, **individual students may be allowed to work alone**, subject to approval. If you have a specific reason for working individually or need to discuss your group arrangement, please contact Mina.
- Sign up for the group on the spreadsheet. A group leader is assigned within each group and is responsible for teamwork and coordination.
- You can contact the TAs to meet him/her for refined consultation.

Project Difficulty and Grading

- All projects will be considered equivalent in terms of difficulty for approval purposes. Choosing a more advanced project will not give you additional credit.
- However, if you would like to challenge yourself and explore a more advanced topic, you are welcome to choose one of the advanced projects.

General Assessment Criteria:

1. Did the group complete all the steps of the data science project?
2. Did the group formulate a valid research question?
3. Did the group use the data to try to answer the research question? Is the presentation self-contained?

4. Is the notebook submission fully explained and well-documented? Did the entire group contribute to the task?
5. Does the work cite relevant sources, and are the authorities acknowledged correctly?
6. Do the report and presentation clearly explain the various aspects of the project and justify the decisions made?

Key Notes for online presentation:

- Maximum Duration: 10 minutes
- Focus on demonstrating and explaining the code, not repeating the written report
- Show how the code works, what each major block does.
